Task Analysis, User Flow & Wireframe Design for an App (App Discovery & Download System)

INTRODUCTION

This experiment focuses on designing a **user-centered application flow** for an app discovery and download system. The goal is to analyze user tasks, map their journey, and represent it visually using wireframes and flow diagrams.

The system includes:

- User authentication (Login/Password Reset)
- App search functionality
- App discovery and installation process

TASK ANALYSIS

1. Primary User Goals

- Access the application securely
- Search for a desired app
- Evaluate app details
- Download the required app

2. Subtasks Breakdown

A. Authentication Task

- Enter login credentials
- Validate login information
- Handle incorrect login (password reset / registration)

B. Search Task

- Search for an application
- Identify whether the app exists

C. Decision Task

- View related apps
- Select the correct app

D. Action Task

- Download the app
- Complete the process successfully

3. Cognitive Considerations

- Users prefer **quick login with minimal input**
- Decision-making is influenced by **clarity and availability of results**
- Error recovery (wrong password/email) is critical for usability

USER FLOW ANALYSIS

Flow Explanation Based on the Wireframe

the wireframe clearly represents a **complete user journey with decision points and alternate paths**.

1. Login Flow

- User starts at **Login Page**
- System checks: **“Login Info Correct?”**

If YES

- User proceeds to the main page

If NO

- User enters **Password Reset Flow**

2. Password Recovery Flow

- User selects password reset

- System verifies: **“Email Matches?”**

If YES

- Reset email sent
- User enters new password
- Confirmation completed

If NO

- User re-enters email
- If still incorrect → redirected to **Register**

3. App Search Flow

- User searches for an app
- System checks: **“App Found?”**

If NO

- Flow terminates (no results scenario)

If YES

- Related apps are displayed

4. App Selection & Download Flow

- System checks:
“Does the user-specified app exist?”

If YES

- User downloads the app
- Process ends successfully

WIREFRAME ANALYSIS

Overview of the Wireframe

the wireframe is structured as a **flowchart-based UI representation**, showing:

- User decisions (diamond shapes)
- Actions (rectangles/rounded boxes)
- Flow direction (arrows)

Key Strengths

1. Clear Decision-Based Structure

- Logical branching using YES/NO paths
- Covers both success and failure scenarios

2. Error Handling Included

- Password reset flow is well-defined
- Email validation ensures correctness

3. Complete User Journey

- From login → search → selection → download
- Includes termination points for all paths

4. Task-Oriented Design

Each part of your wireframe maps directly to user tasks:

- Login → Authentication
- Search → Discovery
- Download → Completion

5. Logical Flow Representation

- Left side → Authentication
- Right side → App interaction
- Maintains good separation of concerns

UX EVALUATION

Advantages

- Covers all real-world scenarios (success + failure)
- Reduces user confusion with clear branching
- Supports recovery from errors
- Ensures smooth navigation

Limitations

- No visual UI elements (icons, images) yet
- Search results could include filtering options
- No feedback screen after download

Improvements

- Add loading/feedback screens
- Include ratings/reviews before download
- Provide search suggestions
- Add “Remember Me” in login

CONCLUSION

This experiment demonstrates how **task analysis and user flow design** help in building an efficient application interface. The wireframe successfully captures:

- Complete user journey
- Decision-making points
- Error handling mechanisms

By structuring the system into clear steps, the design ensures **better usability, reduced cognitive load, and improved user experience**.

A SIMPLE MODEL OF THE APP:-
